ASI:One Agent Challenge – From Intent to Action

Most AI applications stop at conversation. Your challenge is to go further.

Build an AI agent, register it on Agentverse, and make it discoverable through ASI:One. Your agent should understand a user's intent and take meaningful action to solve a real-world problem.

It could coordinate services, automate a multi-step workflow, analyze live information, make context-aware recommendations, complete transactions, or collaborate with other specialized agents. The problem space and approach are entirely up to you.

We are looking for agents that do more than answer questions. Your project should demonstrate real utility, autonomy, and the ability to turn a user's request into an outcome. Avoid simple chatbots or thin wrappers around a single API.

Mandatory Requirements to qualify for the Fetch Track:
1. Registering your agent on agentverse.ai
2. Showing the interaction with your agent from asi1.ai
3. Submitting your agent profiles, chats and project info through Submission Agent along with Devpost.

Refer the full hackpack here :
https://www.fetch.ai/events/hackathons/la-hacks-ai-hackathon-2026/hackpack

Submission Requirement: In addition to your Devpost submission, you must also submit your project on ASI through the designated Submission Agent.

Refer the submission process here :

What to Build

Build a single agent or multi-agent system that:

- Solves a clearly defined real-world problem.
- Performs multi-step planning, reasoning, or orchestration.
- Uses tools, APIs, external services, data sources, MCP, or other agents to produce an executable outcome.
- Is registered on **Agentverse** and discoverable through **ASI:One**.
- Implements the **Agent Chat Protocol (ACP)**.

- Allows the complete primary workflow to be demonstrated directly inside an **ASI:One** conversation without requiring a custom frontend.
- **(Recommended)** Uses **ASI1 Interactive Cards** to provide rich, guided user interactions such as forms, carousels, review screens, detail views, or custom interactive layouts directly inside ASI:One conversations.

You may use any framework, including Google ADK, LangGraph, CrewAI, OpenAI Agents SDK, Claude Agent SDK, uAgents, or plain Python.

Basic Requirements

To be eligible for prizes, your project must:

- Register at least one agent on **Agentverse**.
- Implement the **Agent Chat Protocol (ACP)**.
- Be discoverable and directly usable through **ASI:One**.
- Demonstrate meaningful tool execution or multi-agent orchestration.
- Complete the primary user workflow entirely within an **ASI:One** conversation.
- Submit a public GitHub repository with instructions to run or test the project.

Bonus Points

Projects may receive additional consideration for:

- Effective multi-agent collaboration.
- Implementation of the **Payment Protocol** with a credible monetization model.
- Effective use of **ASI Interactive Cards** to create intuitive, guided, and action-oriented user experiences inside ASI:One.
- Strong reliability, error handling, and recovery from failed tool calls.
- Creative use of real-time data and external services.
- An agent that could realistically continue operating after the hackathon.
